

TACOS GAVILAN — EXECUTIVE REPORT

STRATEGIC EVALUATION: IN-HOUSE PLATFORM (TEG-MODERNIZADO) VS. RESTAURANT365

Comprehensive Discovery Analysis, Asymmetric Technical Advantages, and Capital-Efficient Roadmap to Institutional Financial Visibility

Target Audience: Roberto Velazquez & Erick Velazquez	Date: September 8, 2026
Author: Carlos Velazquez (GM Lynwood #14 & Lead Architect)	Classification: Proprietary & Confidential

1. Executive Summary & Discovery Session Debrief

On September 8, 2026, Erick Velazquez and Carlos Velazquez engaged in an executive discovery session with Restaurant365 (R365), represented by Account Executive **Zane Roegiers** and Solutions Consultant **Eddy Salas**. The purpose of this engagement was to evaluate R365's multi-unit restaurant management software, identify potential operational upgrades for Tacos Gavilan, and assess whether third-party software licensing is warranted.

Core Assessment: The sales team from Restaurant365 departed the meeting **visibly deflated and disappointed**. R365's standard multi-unit pitch relies heavily on dangling a generic '\$1.15 Million annual savings' figure by promising to introduce basic controls (POS connection, digital recipe books, and par ordering). However, as Erick and Carlos systematically demonstrated throughout the call, **Carlos has already engineered and deployed over 75% of R365's core operational capabilities** directly within Tacos Gavilan's custom platform (teg-modernizado) at zero recurring subscription cost.

The Turning Point of the Meeting (Minute 20:00 of Audio Recording):

Zane Roegiers: 'Today Eric, where do your recipes live? In an Excel sheet? In a book?'

Erick Velazquez: 'We have our recipes within our app... it connects with Toast POS every 15 minutes, and we compare what was used, what was supposed to be used, and what was actually used.'

Eddy Salas (translating Carlos's explanation at Min 47): 'Yeah Zane, he says it's pretty close to what you're showing... sounds like it's pretty similar according to Carlos.'

Faced with the reality that Tacos Gavilan already owns live Toast API sales aggregation, real-time recipe depletion, and automated store-to-commissary requisitions, R365 was forced to abandon its operational sales pitch and retreat into offering basic QuickBooks data entry assistance. Engaging R365 would incur an unjustified financial drain of **\$54,000 to \$90,000 USD annually** plus **\$15,000 to \$25,000 USD in onboarding fees**, for functionality that Carlos can finalize in-house in a matter of weeks.

2. Comprehensive System Audit: Existing Assets in teg-modernizado

An exhaustive architectural audit of the Tacos Gavilan codebase confirms that the current proprietary infrastructure is remarkably advanced, scalable, and tailored specifically to high-volume Mexican taqueria operations:

- **Toast POS Real-Time Data Pipeline:** Direct Toast API synchronization running every 15 minutes. Ingests check-level guest transactions, payment methods, tips, delivery channels (Uber Eats, DoorDash, Grubhub), and hourly sales curves without third-party middleware fees.
- **Dynamic PMIX & Virtual Recipe Engine:** Deconstructs menu sales into raw grams and ounces. Uniquely handles complex catering orders through dynamic Virtual Party Tray recipe generation (scaling proteins, beans, rice, salsas, and packaging from 15 to 40 persons on the fly).
- **Central Commissary (La Bodega) Par Ordering:** A complete digital requisition engine connecting all 15 restaurant locations to La Bodega. Managers execute physical counts and generate replenishments based on dynamic Par Levels, allowing the central purchaser to allocate warehouse inventory and coordinate delivery routes.
- **Proprietary Grill Cooking Pace (/preparador):** An industry-first operational tool projecting exact raw meat requirements (lbs of Asada, Pastor, Pollo, Cabeza, Lengua) for the grill master in 30-minute intervals. Features an Intraday Sales Accelerator comparing live sales against historical curves to adjust production pace in real time.
- **Automated California Labor & Break Compliance:** Continuous monitoring of California meal break mandates (5th-hour rules, second breaks). Reconciles Toast time punches, flags penalties, and automates bi-weekly manager schedule publication to eliminate wage-and-hour liability.
- **Supplier Price Radar & Purchasing Audit:** Algorithmic price variance tracking across broadline vendors (Viele & Sons, Shamrock). Reverse-engineered Sage 100 ClearNine DataTables API, enabling instant parallel querying of 2,614+ historical orders (\$1.01M+ USD) across all 15 branches in 1.2 seconds.
- **Balanced Accounting Journal Generator:** Built-in replacement for the legacy Cohesion bridge (lib/accounting-journal.ts). Generates balanced double-entry GL journal batches (Credits: Sales 40050, Delivery 40060; Debits: Receivables, Cash Deposits, Card Fees) directly mapped to QuickBooks Online.
- **100% Native Bilingual Enterprise UX (i18n):** Full-stack internationalization framework (lib/i18n.tsx) ensuring zero hardcoded user strings. Instant toggle between Spanish and English across all tablet and desktop screens.

3. Asymmetric Advantages: What teg-modernizado Does That R365 Cannot Replicate

Restaurant365 is a generic, backward-looking accounting software designed for sit-down dining and burger franchises. It is fundamentally incapable of running line-level taqueria operations:

Operational Capability	teg-modernizado (In-House)	Restaurant365 (Generic SaaS)	Strategic Business Impact
Line-Level Cooking Pace (Parrilla)	Proactive Live Guidance: Tells the grill cook exactly how many raw lbs to lay on the grill every 30 mins based on live sales.	Completely Absent: R365 only looks in the rear-view mirror days later. Zero live line forecasting.	Massive Freshness & Waste Control: Prevents meat overcooking and drying on the steam table.
Commissary Meat Marination Yields	Native Taqueria Workflow: Models raw-to-marinated shrinkage and cryovac batch packaging specific to La Bodega.	Rigid Generic Inventory: Treats central kitchens like external third-party distributors; clumsy batch tracking.	Formula Accuracy: Eliminates false food cost spikes caused by marinade absorption.
Toast Integration Speed & Parity	15-Minute Sync Cycles: Full item, modifier, and ticket level mapping directly from Toast API without middleman delays.	Nightly Batch Processing: Most R365 reports update only once every 24 hours overnight.	Intraday Agility: Store leadership can react to sales trends before the shift ends.
Party Tray Dynamic Scaling	Algorithmic Virtual Recipes: Dynamically scales protein portions (15-40 pax) without cluttering recipe databases.	Static Parent-Child SKU Hell: Requires manual creation of hundreds of static recipes.	Labor Savings: Zero administrative burden when catering menu items change.
Total Cost of Ownership (TCO)	\$0 Recurring Licensing: 100% company-owned proprietary intellectual property.	\$60,000 - \$90,000/yr: Monthly per-store fees + \$20k setup + recurring user seat charges.	Permanent Capital Retention: Preserves cash flow for branch expansion.

4. The Missing 20%: Engineering Roadmap to Exceed R365 Capabilities

Erick Velazquez was clear: **ownership does not need basic store operations; they need Executive Financial Visibility.** Below is the development blueprint to deliver the remaining 20% in teg-modernizado:

- **Phase 1: Multi-Location Side-by-Side P&L; Dashboard (/admin/finanzas/pnl):** Replicate R365's flagship financial report: a dynamic, side-by-side grid displaying all 15 branches plus Consolidated Total (Sales, Prime Cost, OpEx, EBITDA, Net Profit). Gives ownership instant weekly visibility into store performance.
- **Phase 2: Commissary Markup & Intercompany Elimination Engine:** Solves the 'weird numbers' identified by Erick. Store P&L; books the transfer price (\$3.30/lb) to hold managers accountable; Consolidated Corporate P&L; automatically eliminates internal markups to book true vendor cost (\$3.00/lb).
- **Phase 3: Actual vs. Theoretical (AvT) Visual Loss Table (/admin/inventario/varianza):** Displays Ingredient | Unit | Unit Cost | Theoretical lbs | Actual lbs | Variance | Dollar Loss (\$) | Efficiency %. Ranked by highest dollar loss so supervisors can target meat/cheese leakage immediately.
- **Phase 4: Automated Brand Expense Prorating (Meta Ads & Shared OpEx):** Centrally books brand-level expenses (\$1,500 Meta ads) and automatically prorates them evenly across the 15 stores.

5. Total Cost of Ownership (TCO): 3-Year Capital Comparison

Expense Category	Restaurant365 (15 Stores + Bodega)	teg-modernizado (In-House)	Total Capital Savings
Base Software License (Year 1)	\$72,000 USD (\$400/mo x 15 stores)	\$0 USD (Included in existing hosting)	+\$72,000 USD
Onboarding, Implementation & Setup	\$20,000 USD (Mandatory vendor fee)	\$0 USD (Internal agile deployment)	+\$20,000 USD
Software Licenses (Years 2 & 3)	\$144,000 USD (Annual recurring fee)	\$0 USD (No recurring per-store fee)	+\$144,000 USD
Customization & Change Requests	\$12,000+ USD (Paid vendor work orders)	\$0 USD (Carlos builds it in-house)	+\$12,000 USD
Total 3-Year Capital Commitment	\$248,000 USD	\$0 Additional SaaS Fees	+\$248,000 USD SAVED

6. Strategic Recommendation & Next Steps for Leadership

1. Politely Decline Third-Party Software Subscriptions:

Restaurant365 provides no technical capabilities that justify extracting nearly a quarter-million dollars from Tacos Gavilan over the next 3 years. Their sales reps realized during the call that Carlos's custom platform is already ahead of them on operational taqueria logic.

2. Greenlight Phase 1 & Phase 2 In-House Development:

Direct Carlos to prioritize the **Multi-Location Side-by-Side P&L; Dashboard** and the **Commissary Elimination Engine**. This will give Roberto and Erick the exact institutional visibility they need on a weekly basis, resolving the accounting lag and eliminating vendor dependency permanently.

3. Protect Company Data & Operating Margins:

By keeping Tacos Gavilan's recipes, sales curves, and purchasing intelligence within proprietary infrastructure, ownership maintains 100% intellectual property sovereignty and avoids being held hostage by escalating SaaS price increases.
