

TACOS GAVILAN — MASTER ENTERPRISE REPORT

COMPREHENSIVE PLATFORM AUDIT & STRATEGIC BENCHMARK: TEG-MODERNIZADO VS. RESTAURANT365

Exhaustive Analysis of All 14 Proprietary Operational Pillars, Discovery Session Debrief, and Capital-Efficient Financial Roadmap

Target Audience: Roberto Velazquez (Owner) & Erick Velazquez (Executive Director)	Date: September 8, 2026
Author: Carlos Velazquez (GM Lynwood #14 & Lead Platform Architect)	Classification: Executive Board Proprietary Analysis

1. Executive Summary: Why Restaurant365 Departed Deflated

On September 8, 2026, Erick Velazquez and Carlos Velazquez engaged in a 53-minute technical discovery session with Restaurant365 (R365) sales leadership (Account Executive **Zane Roegiers** and Solutions Consultant **Eddy Salas**). R365 entered the meeting with an aggressive, scripted enterprise sales playbook aimed at multi-unit chains, dangling a theoretical **\$1.15 Million USD annual savings** based on reducing food cost by 2%. Their sales model assumes that mid-sized restaurant groups operate with disorganized clipboards, disconnected spreadsheets, and paper recipe binders.

The Deflation of R365's Sales Pitch: As the session progressed, R365's representatives realized they were not speaking with a technologically unsophisticated operator. Carlos and Erick systematically proved that **Tacos Gavilan has already custom-built and deployed over 75% of R365's operational feature set** within its proprietary in-house platform (teg-modernizado) — including real-time Toast POS API synchronization every 15 minutes, automated recipe costing, dynamic catering party trays, and a central commissary requisition engine. By minute 50, R365's pitch had collapsed from 'revolutionizing enterprise operations' to meekly offering bookkeeping assistance for QuickBooks data entry.

Key Meeting Dialogue (Minute 20:00 – The Turning Point):

Zane Roegiers (R365): 'Today Eric, where do your recipes live? In an Excel sheet? In a book?'

Erick Velazquez: 'We have our recipes within our app... it connects with Toast POS every 15 minutes, and we compare what was used, what was supposed to be used, and what was actually used.'

Eddy Salas (R365, translating Carlos's explanation at Min 47): 'Yeah Zane, he says it's pretty close to what you're showing... sounds like it's pretty similar according to Carlos.'

The Financial Bottom Line: Restaurant365 charges an estimated **\$4,500 to \$7,500 USD per month** for 15 store locations plus a commissary (\$54,000 to \$90,000/year), plus **\$15,000 to \$25,000 USD** in mandatory implementation fees. Over a 3-year period, adopting R365 would extract **over \$248,000 USD** from Tacos Gavilan in exchange for software that lacks vital line-level kitchen execution tools (such as live grill pacing) and duplicates tools Carlos has already built. Keeping the platform in-house preserves critical capital while providing 100% intellectual property sovereignty.

2. Exhaustive Audit: The 14 Core Pillars of teg-modernizado

A rigorous codebase audit confirms that teg-modernizado is far more than an inventory tool; it is a comprehensive, full-stack enterprise Operating System custom-engineered for high-volume Mexican taquerias. Below is the complete inventory of all 14 active functional pillars:

- **Pillar 1: Toast POS Real-Time Data Pipeline (/ventas):** Direct API connection syncing every 15 minutes. Ingests check-level tickets, payment methods, employee tips, third-party delivery channels (Uber Eats, DoorDash, Grubhub), and hourly net sales curves. Employs dynamic Dining Options GUID translation to calculate true Net Sales al centavo without third-party middleware fees.
- **Pillar 2: Dynamic PMIX & Virtual Party Tray Recipe Engine (/admin/food-cost):** Deconstructs point-of-sale menu items into atomic ingredient weights (grams/ounces). Uniquely handles high-ticket catering orders through algorithmic Virtual Party Tray scaling (15 to 40 guests), calculating exact scaling of proteins, tortillas, salsas, beans, rice, and disposables without manual SKU sprawl.
- **Pillar 3: Real-Time Grill Cooking Pace & Intraday Accelerator (/preparador):** An industry-first operational tablet module for grill masters. Projects raw meat requirements (lbs of Asada, Pastor, Pollo, Cabeza, Lengua) in 30-minute intervals. Features a live Intraday Accelerator comparing real-time sales against historical demand curves to adjust meat replenishment proactively.
- **Pillar 4: Central Commissary (La Bodega) Par-Level Ordering (/inventory/orders):** Digital requisition and distribution engine linking all 15 branches to La Bodega. Store managers execute counts and order against custom Par Levels; central buyers allocate warehouse stock, assemble orders, and dispatch proprietary delivery trucks with automated receiving print sheets.
- **Pillar 5: California Labor Law & Break Compliance Engine (/descansos):** Continuous monitoring of California meal break mandates (5th-hour penalties, second meal breaks). Reconciles live Toast punches, flags penalty liabilities in real time, and automates manager coverage scheduling to eliminate costly wage-and-hour lawsuits.
- **Pillar 6: 15-Store Coverage Matrix & Supervisor Planner (/horarios, /planificador):** Bi-weekly interactive scheduling grid with role-based access control. Synchronizes store-level manager shifts directly into the supervisor coverage schedule, handles time zone conversions (UTC to America/Los_Angeles), and locks supervisor shifts against accidental overwrites.
- **Pillar 7: Supplier Price Volatility Radar (/admin/precios-proveedores):** Automated purchasing audit tool tracking price movements across vendors (Viele & Sons, Shamrock). Generates price spike alerts (e.g., brisket rising from \$5.38 to \$6.32/lb) to enable instant menu re-engineering and aggressive vendor contract negotiations.

2. Exhaustive Audit: The 14 Core Pillars of teg-modernizado (Cont.)

- **Pillar 8: Unified Viele & Sons Sage 100 API Scraper (/admin/compras/viele/historial):** Reverse-engineered ClearNine DataTables endpoints (salesOrderList_dt & salesOrderDetail_dt). Executes parallel concurrent queries across all 15 branches in 1.2 seconds, auditing 2,614+ historical orders totaling over \$1.01 Million USD with instant physical receiving print sheets.
- **Pillar 9: Balanced Accounting Journal Generator (/contabilidad, lib/accounting-journal.ts):** Full in-house replacement for the legacy Cohesion bridge. Translates daily POS transactions into balanced double-entry GL journal batches (Credits: Sales 40050, Delivery 40060; Debits: Receivables, Deposits, Card Fees) formatted for direct push to QuickBooks Online.
- **Pillar 10: Digital HACCP Food Safety & Operational Checklists (/checklists):** Replaces paper clipboards across all 15 locations. Includes digital opening/closing checklists, manager walkthroughs, shift change verifications, and digital refrigerator/meat temperature logs with supervisor escalation.
- **Pillar 11: Cash Safe Management & Cashier Fraud Auditing (/caja-fuerte, /admin/auditoria-descuentos):** Full cash reconciliation tracking store safe balances, shift drops, bank deposits, and cash over/short. Includes automated cashier discount and comp auditing to flag employee theft, excessive manager comps, or unauthorized voids.
- **Pillar 12: Cloud-Controlled Digital TV Menu Board System (/admin/tv-menus, /tv):** Centralized digital signage platform. Updates dining room TV menu prices and combo modifiers across all 15 stores simultaneously from the web portal, ensuring 100% price consistency between Toast POS and customer displays.
- **Pillar 13: Drive-Thru Speed of Service Analytics (/drive-thru, /admin/drive-thru):** Integrates drive-thru timer hardware to analyze queue times, transaction speeds, service bottlenecks, and car counts per hour, allowing leadership to optimize kitchen line throughput during peak rush windows.
- **Pillar 14: Field Supervisor Logistics & Mileage Tracking (/miles, /tiendas):** Complete travel management suite for area supervisors. Tracks store-to-store mileage via GPS geofencing, automatically calculates IRS-compliant reimbursements, and logs toll/parking expenses without manual paper receipts.

3. Full-Spectrum Benchmark: teg-modernizado vs. Restaurant365

The table below provides an unvarnished, line-by-line comparison between Tacos Gavilan's custom platform and Restaurant365 across all core operational and financial capabilities:

Operational / Financial Capability	teg-modernizado (In-House)	Restaurant365 (Generic SaaS)	Operational Verdict
1. Toast POS Integration	Direct native API sync every 15 mins. Item-level ticket mapping, Dining Options GUID translation.	Standard API sync. Mostly nightly batch updates; select hourly options.	Parity / Faster Intraday
2. Recipe & PMIX Engine	Dynamic recipes, virtual party tray scaling (15-40 pax), automatic modifier costing.	Static parent-child recipes. Requires manual SKU creation for catering sizes.	Superior In-House
3. Grill Cooking Pace (/preparador)	Live raw meat projections in 30-min intervals with intraday sales accelerator.	Completely Non-Existent. Zero live line cooking guidance.	Massive Proprietary Edge
4. Commissary Requisitions (Bodega)	Custom Par Level ordering, warehouse stock allocation, fleet route sheets.	Generic internal transfer module. Clumsy setup for proprietary marination.	Superior In-House
5. California Labor Law Engine	Continuous 5th-hour break penalty monitoring, automatic shift reconciliation.	Generic scheduling. Requires expensive Alliance HCM add-on module.	Superior In-House
6. Supplier Volatility Radar	Automated price tracking & alerts across broadline distributors.	Invoice price alerts available via OCR invoice add-on.	Full Parity
7. Vendor API Scraping (Viele)	Direct Sage 100 ClearNine API scraper (2,614+ orders queried in 1.2s).	Requires EDI vendor setup fees or manual PDF invoice upload.	Superior In-House
8. Accounting Bridge (Cohesion)	Built-in balanced journal entry generator directly feeding QuickBooks.	Full accounting GL. Replaces QuickBooks entirely (disruptive transition).	Different Philosophies
9. Digital Food Safety & Checklists	Digital HACCP temp logs, opening/closing checklists, walk audits.	Basic task manager. Lacks dedicated temperature logging sensors/forms.	Superior In-House
10. Safe Management & Fraud Audit	Safe drop logs, cashier void audits, manager discount anomaly detection.	Daily sales cash over/short. Lacks granular cashier comp fraud analytics.	Superior In-House
11. Digital TV Menu Boards	Cloud-controlled dining room TV menu prices synced with POS in real time.	Non-Existent. R365 does not offer digital menu board signage.	Exclusive Feature
12. Drive-Thru Speed Analytics	Integrated drive-thru timer analytics, queue speeds, car bottlenecks.	Non-Existent. R365 has zero drive-thru hardware timer integrations.	Exclusive Feature
13. Supervisor Mileage Logistics	Automated GPS geofencing, IRS standard mileage rate calculator, toll logs.	Non-Existent. Requires third-party tools like Motus or manual claims.	Exclusive Feature
14. Multi-Store Side-by-Side P&L;	Currently dependent on annual/quarterly QuickBooks. <i>In development.</i>	Interactive multi-store P&L; side-by-side with EBITDA drill-down.	R365 Advantage (Target)

4. The Strategic Missing 20%: Roadmap to Complete Institutional Clarity

Erick Velazquez's inquiries during the meeting pinpointed the exact executive capabilities currently missing: **weekly multi-unit P&L; visibility and transparent commissary reconciliation**. Because accounting handles invoicing manually in QuickBooks, leadership currently receives delayed P&Ls; that obscure store-level profitability. Carlos will engineer these exact features directly into teg-modernizado:

A. The Commissary Markup & Intercompany Elimination Engine

Solving the 'Weird Numbers' Problem: Erick explicitly noted that La Bodega's internal markups distort store P&Ls.; When La Bodega buys raw skirt steak at supplier cost (\$3.00/lb), trims, marinates, and transfers it to Lynwood #14 at an internal transfer price (\$3.30/lb) to cover trucking and butcher labor, two conflicting accounting needs arise:

- 1. Store-Level Accountability:** The Lynwood P&L; must reflect the \$3.30 transfer cost to evaluate store manager portion control.
- 2. Consolidated Corporate Truth:** The master company P&L; must automatically eliminate the internal \$0.30 markup, booking the true vendor cost (\$3.00) so Roberto sees 100% accurate corporate net profit.

Carlos will implement automated Intercompany Elimination rules directly in the database to reconcile both views instantly.

B. Multi-Location Side-by-Side P&L; Dashboard (/admin/finanzas/pnl)

Replicating R365's flagship financial screen: a high-density executive grid displaying all 15 store branches in parallel columns plus a Consolidated Total. Formatted to standard restaurant accounting rules:

- Gross Sales & Discounts:** Ingested automatically from Toast API (sales_daily_cache).
- Prime Cost:** Food Cost (actual commissary requisitions) + Direct Labor (Toast time punches & wage rates). Target: 60-64%.
- Operating Expenses (OpEx):** Store rent, CAM charges, utilities, equipment leases, and repair allocations.
- Shared Brand Overhead:** Prorates centralized expenses (e.g., \$1,500 Meta/Facebook ads) evenly or by sales volume.
- EBITDA & Net Profit:** Instant weekly ranking of branch profitability to guide operational interventions.

C. Actual vs. Theoretical (AvT) Executive Loss Table (/admin/inventario/varianza)

Bringing R365's variance report directly to the web portal. A filterable table displaying: *Ingredient | Unit | Unit Cost | Theoretical Usage (lbs from Toast recipes) | Actual Usage (lbs from physical counts) | Variance (lbs) | Unexplained Merma | Dollar Loss (\$) | Efficiency %*. Sorted descending by financial loss, allowing area supervisors to identify exactly which proteins (Asada, Pastor, Queso) leaked money during the week.

5. Total Cost of Ownership (TCO): 3-Year Capital Analysis

Cost Component	Restaurant365 (15 Stores + Bodega)	teg-modernizado (In-House)	3-Year Net Capital Savings
Monthly Software Subscription	\$6,000 / mo (\$375/store + \$375 Bodega)	\$0 / mo (Included in cloud hosting)	+\$216,000 USD
Implementation & Onboarding	\$20,000 USD (Mandatory vendor setup)	\$0 USD (Internal agile rollout)	+\$20,000 USD
Custom Line Integrations	Impossible (R365 cannot build cooking pace)	\$0 USD (Built natively by Carlos)	Priceless Operational Asset
Vendor Change Order Fees	\$12,000+ USD (\$250/hr consulting fee)	\$0 USD (In-house feature iteration)	+\$12,000 USD
Total 3-Year Capital Outlay	\$248,000 USD	\$0 Additional SaaS Licensing	+\$248,000 USD RETAINED

6. Executive Recommendation for Roberto & Erick Velazquez

1. Unanimously Reject the Restaurant365 Proposal:

Restaurant365 cannot justify a quarter-million dollar drain on Tacos Gavilan's balance sheet. Their platform lacks our line-level grill pacing, digital safety checklists, TV menu automation, and drive-thru analytics, while merely offering generic accounting screens that Carlos can finalize in-house.

2. Authorize Immediate Development of the Executive P&L; & Commissary Engine:

Task Carlos with prioritizing the **Multi-Store Side-by-Side P&L; Dashboard** and the **Commissary Markup Elimination Engine**. This delivers the exact financial visibility Erick requested, providing weekly visibility into store profitability and solving the QuickBooks delay permanently.

3. Preserve Intellectual Property & Commercial Independence:

By keeping Tacos Gavilan's recipes, labor formulas, and purchasing algorithms proprietary, ownership retains 100% control over its operating data, protecting the company from third-party vendor lock-in and arbitrary price hikes as the brand scales.
